Ideation Phase
Empathize & Discover

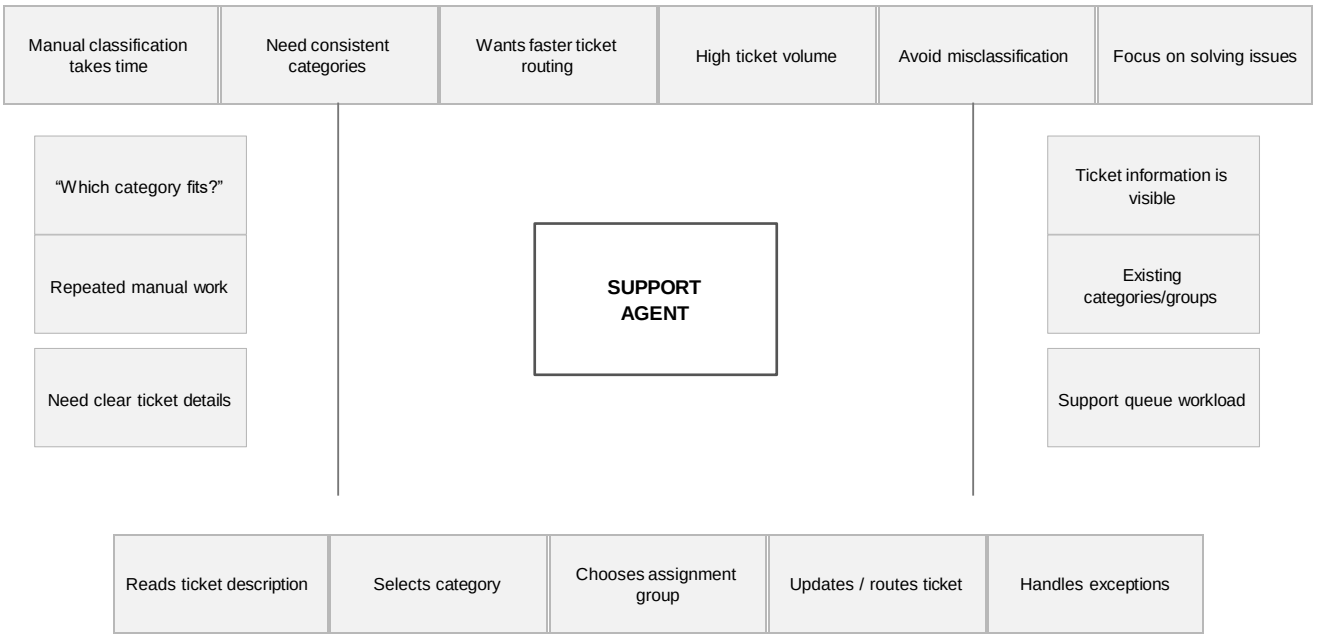

Date	29-09-2026
Team ID	SWTID-2026-6413
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool to help teams better understand their users. Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise helps participants consider the user's perspective, goals and challenges.

Project-specific Empathy Map:

Pain
- Manual effort
- Inconsistent classification
- Delayed routing
- Repetitive work

Gain
- Faster classification
- Consistent routing
- Reduced manual work
- Quicker assignment

Discover – Auto Ticket Classification using Flow Designer

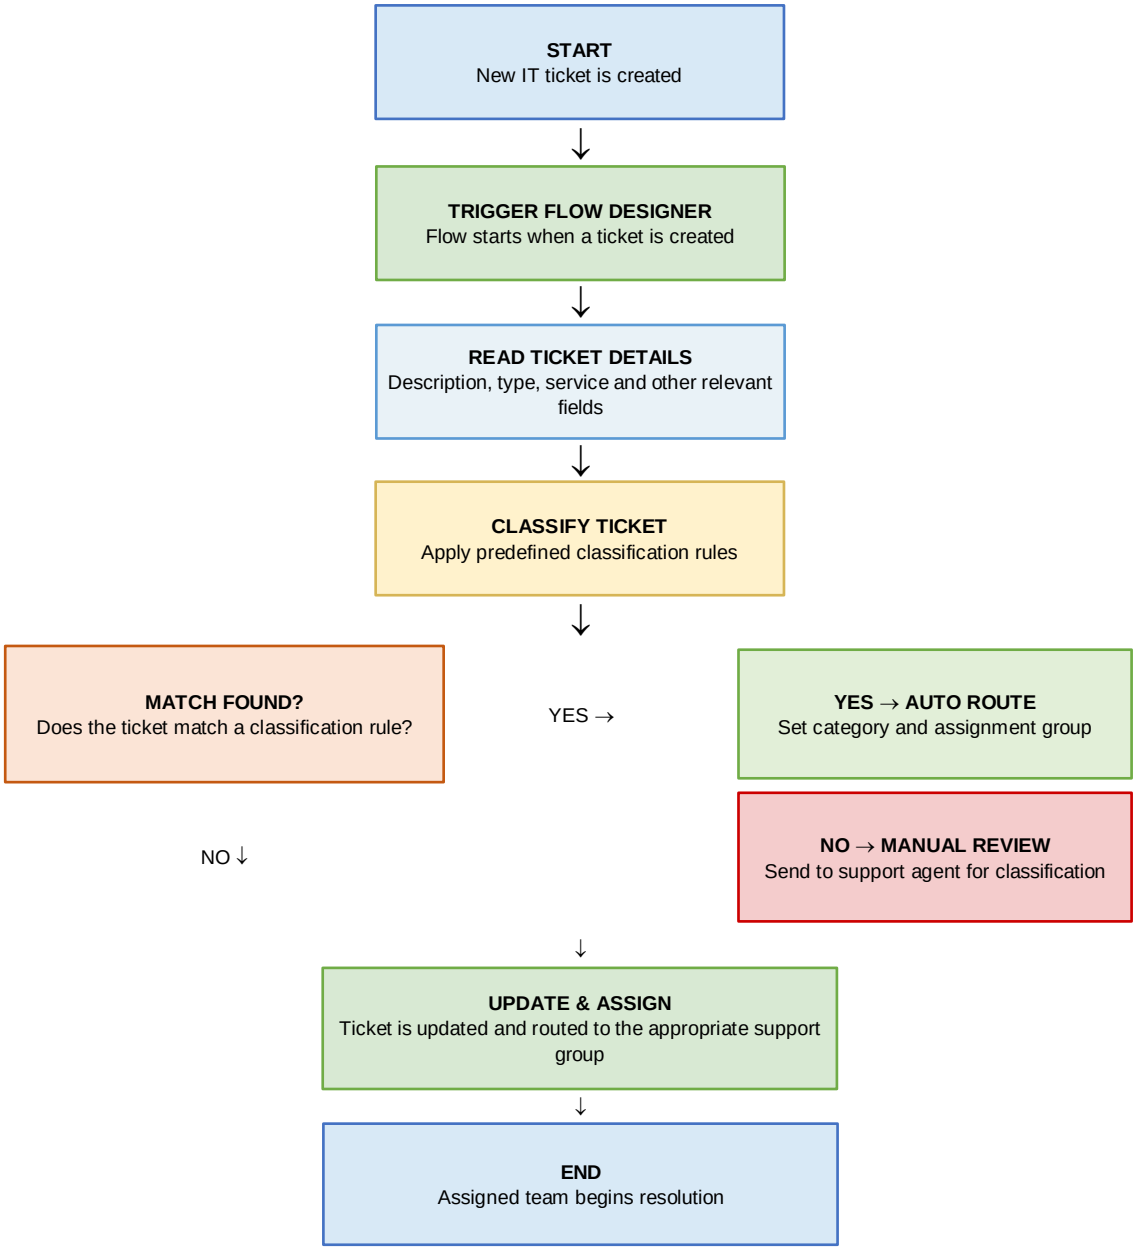

The Discover stage converts the empathy findings into the core problem, requirements and an automation opportunity.

What we observe	What it means
Agents manually read each incoming ticket.	Classification depends on human review.
Agents choose category/type and assignment group.	The same type of ticket may be classified differently.
Classification happens before routing.	Tickets can wait before reaching the right team.
Many tickets contain repeated patterns.	Some classification work can be handled by predefined rules.

DISCOVERED CORE PROBLEM

Incoming IT tickets require manual classification and routing. This creates repetitive work for support agents, can cause inconsistent categorization, and may delay assignment to the appropriate support team.

New Flowchart Design – Automated Ticket Classification

Expected outcome: Automate routine ticket classification and routing while keeping an exception path for tickets that do not match predefined rules.

This flowchart represents the proposed solution direction; the exact classification rules and fields should be configured according to the project's ticket data.
