Customer Journey Map: IT Support End-to-End Experience

Project: Auto Ticket Classification & Routing using Flow Designer

ServiceNow Automation Blueprint

	1. ENTICE Awareness & Need	2. ENTER Submission & Trigger	3. ENGAGE Auto-Classify & Route	4. EXIT Resolution & Update	5. EXTEND Feedback & Audit
Steps Key actions user takes	User encounters an IT issue or service request (e.g., VPN failure, password reset).	Opens Portal/Virtual Agent, types problem description, submits ticket.	Flow Designer triggers: reads fields, applies rules, sets category & assignment group.	Assigned agent receives accurately routed ticket and resolves issue immediately.	User confirms resolution; system logs rules accuracy for future model improvement.
Interactions Touchpoints & Places	**Touchpoint:** Service Portal / Workstation **People:** Employee / Ticket Raiser	**Touchpoint:** Ticket Form / Virtual Agent **Things:** Short description, priority	**Touchpoint:** Flow Designer Engine **Things:** Logic rules, Keyword matchers	**Touchpoint:** Workspace / Email **People:** Support Agent, User	**Touchpoint:** Survey / Audit Log **People:** IT Administrator
Goals & Motivations "Help me..."	"Help me log my issue quickly without needing to know internal IT team structures."	"Help me get my ticket to the right team immediately with minimal effort."	"Help us eliminate manual classification backlog and misrouted tickets."	"Help me get my problem fixed faster so I can return to work without delay."	"Help us monitor automated routing accuracy and continuously refine rules."
Positive Moments What delights the user?	Easy access to ticket portal from any corporate device.	Simple, clean form; no mandatory technical dropdowns required.	Instant instant-classification notification & correct assignment within seconds.	Fast response time because ticket arrived directly at expert team.	Zero bounce-back between support groups; high satisfaction score.
Negative Moments Pain points & Friction	Unsure which portal category fits complex multi-part issues.	Vague descriptions might cause hesitation before submission.	Edge case tickets with ambiguous keywords default to manual review fallback.	Slight delay if manual review is needed for unclassified tickets.	Frustration if automated rule incorrectly categorizes an atypical ticket.
Opportunities Ideas for improvement	Provide real-time auto-suggestions as user types issue description.	Implement keyword prompt assistance in Virtual Agent interface.	Incorporate Machine Learning / Predictive Intelligence alongside Flow Designer.	Automate instant fulfillment for high-confidence routine requests (e.g., auto-resets).	Create automated agent feedback loop ("Re-classify") to update Flow rules automatically.
