Team ID	SWTID-2026-6413
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

PROJECT DESIGN PHASE-II

Data Flow Diagram & User Stories

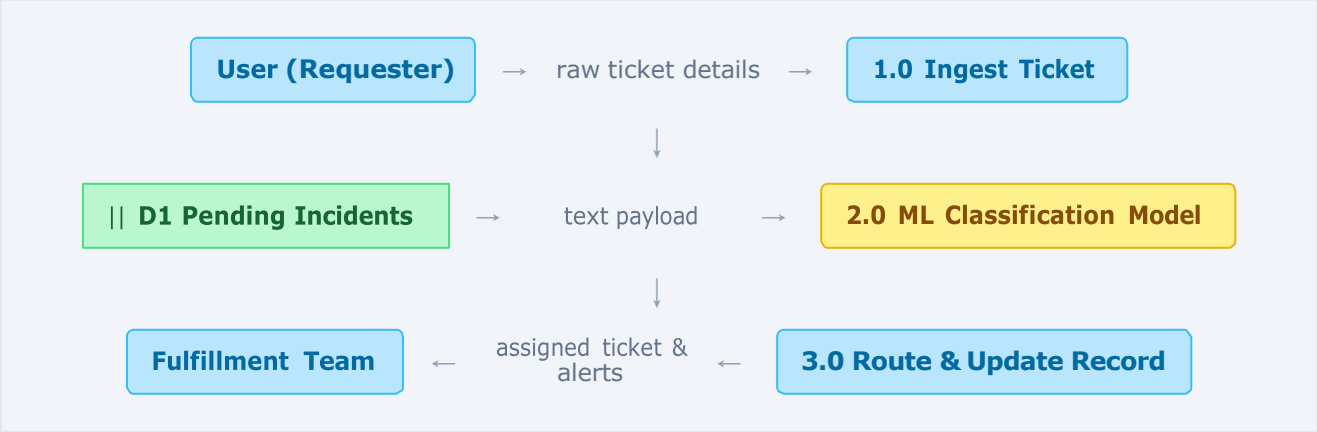

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

System Flow (Auto Ticket Classification):

1. **User** submits a new Support Incident via the Service Portal, entering only a short description and details.
2. **Flow Designer** trigger detects the newly created unclassified Incident record.
3. Text data (Short Description, Description) is extracted and sent to the **Machine Learning API / Predictive Intelligence**.
4. The Machine Learning model returns the predicted classification parameters (Category, Subcategory, Assignment Group).
5. **Flow Designer** updates the Incident record with the predicted values and saves it to the database.
6. The system sends a notification to the assigned **Fulfillment Team** for rapid resolution.

Example: DFD Level 0 (Ticket Classification System)

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	Story #	User Story / Task	Acceptance criteria	Priority	Release
Customer (Web user)	Ticket Submission	USN-1	As a web user, I can submit an IT request without manually selecting the technical category or subcategory.	The form allows submission with only 'Short Description' and 'Description' fields.	**High**	Sprint-1
Customer (Web user)	Notifications	USN-2	As a web user, I will receive an email confirmation containing my ticket number once submitted.	System generates an automated email containing the INC number upon submission.	**High**	Sprint-1
IT Agent	Ticket Routing	USN-3	As an IT Agent, I receive tickets that are automatically routed to my group's queue based on the AI's category prediction.	Tickets populate in the correct assignment group queue within seconds of creation.	**High**	Sprint-1
IT Agent	Review Predictions	USN-4	As an IT Agent, I can see a confidence score for the automated classification so I know if it needs manual correction.	A 'Confidence Score' field is visible on the Incident form for ITil users.	**Medium**	Sprint-2
Administrator	Flow Configuration	USN-5	As an Administrator, I can build and modify the classification trigger logic using a visual Flow Designer rather than custom scripts.	Flow Designer contains a clear trigger, action to call the ML model, and an update record action.	**High**	Sprint-1
Administrator	Model Retraining	USN-6	As an Administrator, I can retrain the machine learning model using recent ticket data to improve ongoing accuracy.	Admin portal features a 'Retrain Model' button that utilizes tickets closed in the last 6 months.	**Low**	Sprint-2
Service Desk Manager	Dashboard & Analytics	USN-7	As a Manager, I can view a dashboard showing the percentage of tickets successfully auto-classified versus manually re-assigned.	Dashboard visualizes "Auto vs Manual Routing" percentages in a pie chart format.	**Medium**	Sprint-3
