Testing Phase

Date	03 October 2026
Team ID	SWTID-2026-6413
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Testing:

The made Workflow is tested if it works properly for categorising the raised tickets.The primary objective of this testing phase is to validate that the automated ticket classification and notification flows function accurately without errors. The testing strategy evaluates three core dimensions:

- **Functional Accuracy:** Ensuring keywords in the short description trigger the correct routing paths.
- **Data Integrity:** Verifying dependent choice fields map correctly, auto-numbers generate sequentially, and reference fields safely query user data.
- **Notification Delivery:** Confirming the outbound mail subsystem triggers and delivers receipt confirmations to the caller.

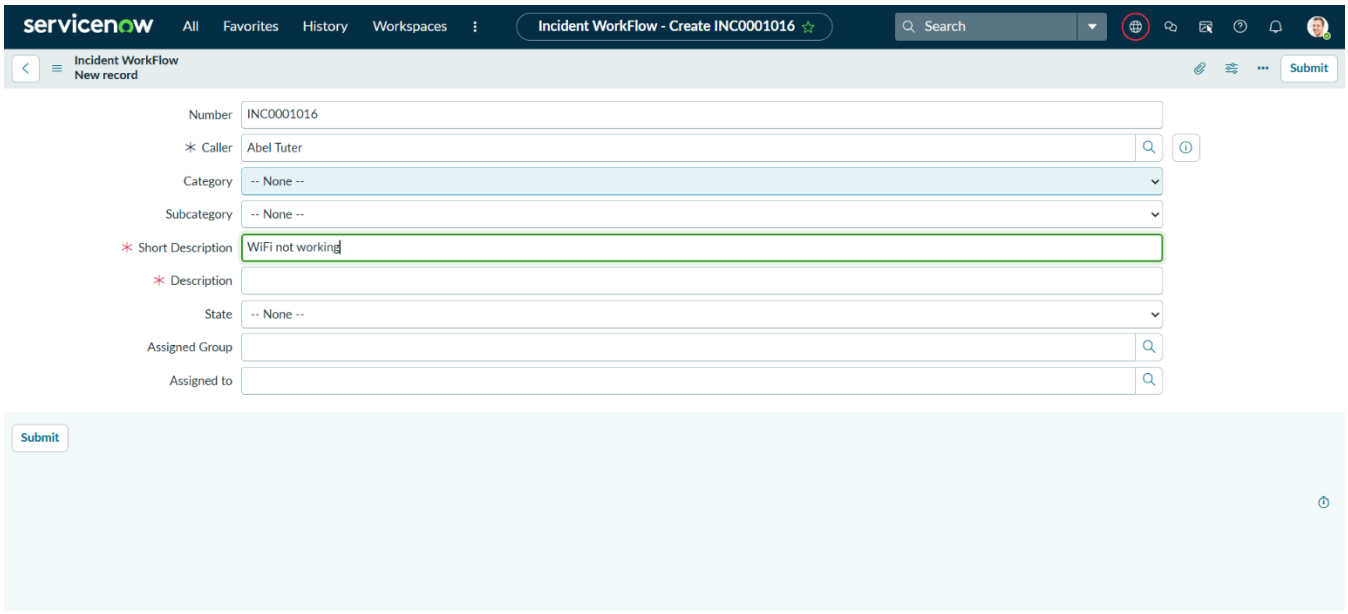

Example:

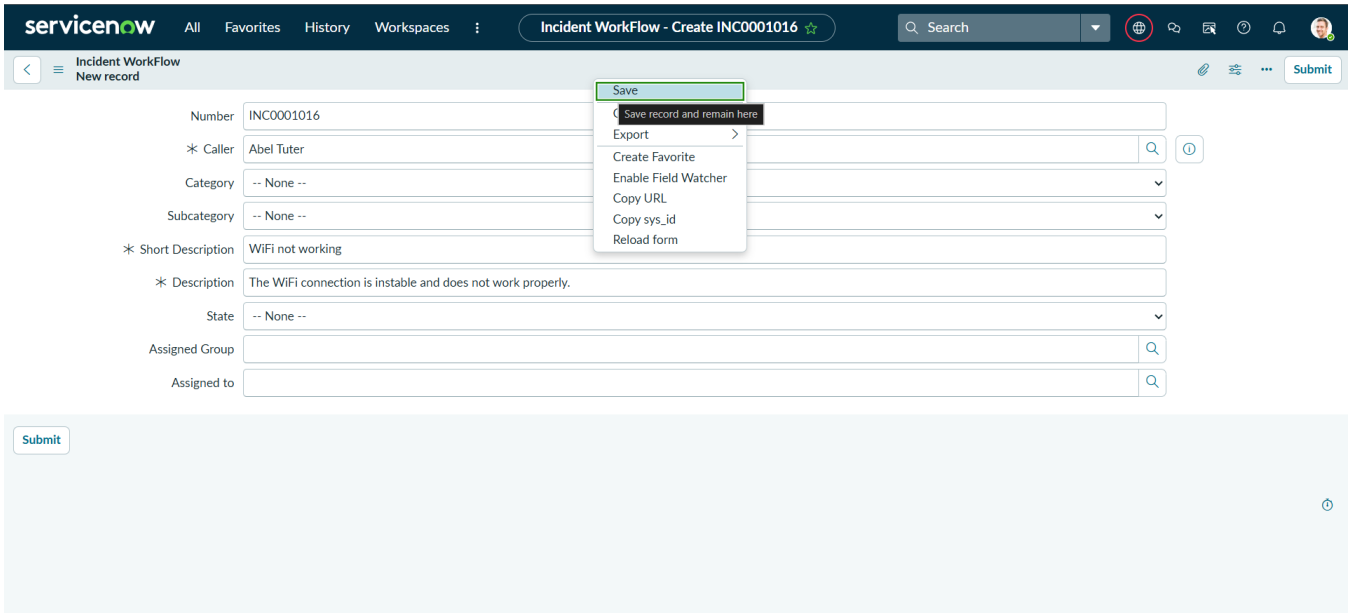

Step 1: Functional Testing Scenario (Incident Creation)

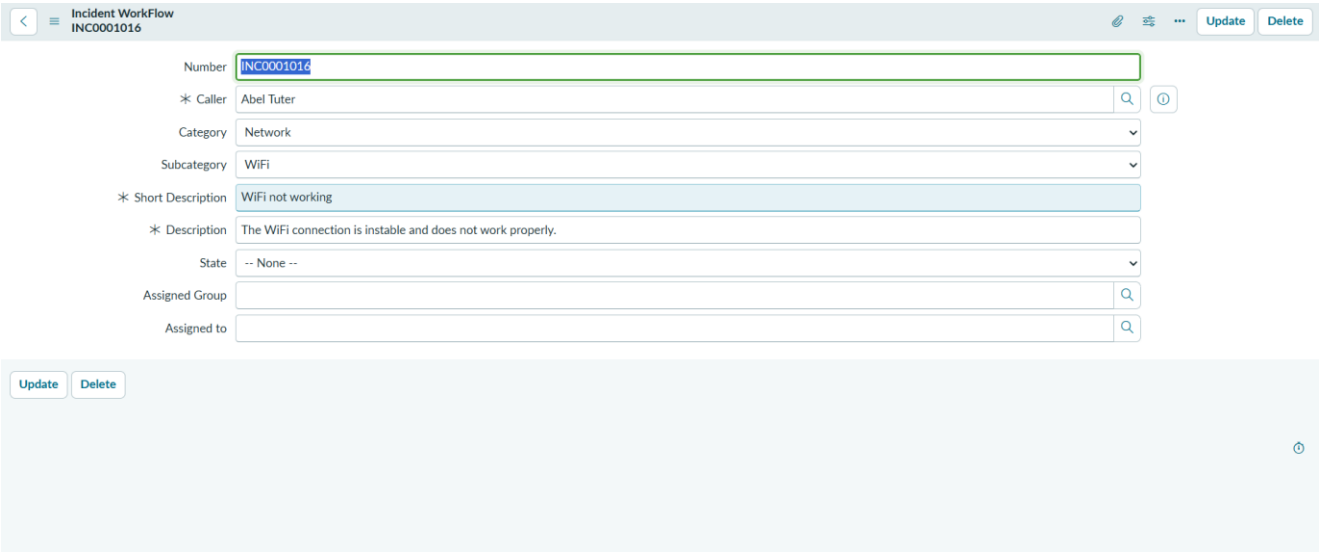

This test validates that when an end-user creates a ticket, the backend system automatically intercepts the short description text, extracts predefined keywords, and applies the correct data classifications without human intervention.

- **Test Component:** User Acceptance Testing (UAT) Incident Baseline.
- **Assigned Test Caller: Abel Tuter**.
- **Execution Steps:**
    1. Navigate to **All Menus** → Search for the custom **Incident WorkFlow** table form.
    2. Click the **New** button on the top right corner of the list view.
    3. Select **Abel Tuter** in the mandatory **Caller** reference field.
    4. Enter the following phrase into the **Short Description** field: "WiFi not working in the library".
    5. Leave both the **Category** and **Subcategory** dropdown fields completely blank.
    6. Click **Save** (or **Submit**) on the form header to instantiate the record.
    7. **Reload the form** to allow the background Flow Designer logic to refresh the layout fields.

- **Observed Automated Classification Results:**
    - **Incident ID:** A unique, non-duplicating ID sequence is generated matching the auto-number schema (*e.g., INC00511*).
    - **Automated Category Selection:** The field automatically populates with **Network** based on keyword matching logic.
    - **Automated Subcategory Selection:** The field dynamically applies dependent choice logic to populate with **Wi-Fi**.

Step 2: Email Sending Verification Phase

Once the ticket classification logic executes successfully, the flow moves immediately to verify that the outbound communication channel properly dispatches an acknowledgment message to the end-user's contact record.

- **Test Component:** ServiceNow System Log Inspection & Content Preview.
- **Execution Steps:**
    1. Navigate to **All Menus** → Search for **Emails**.
    2. Under the **System Logs** application, select the **Emails** module.
    3. Locate the global filter query bar and search using the specific criteria: Subject | contains | Your Request for the issue has been submitted.
    4. Select and open the top transactional mail record generated at the timestamp corresponding to the incident creation step.
    5. Scroll to the bottom menu area and locate the **Related Links** section.
    6. Click the **Preview Email** action button to launch the layout overlay viewer.
- **Observed Verification Log Metrics:**
    - **Recipient Resolution:** The system verified the **To** field target correctly maps to **Abel Tuter's** specific email address layout string.
    - **Mail Output Type State:** The tracking record displays an active, stable state of **send-ready** (or *sent*), indicating successful processing through the SMTP mail handler engine.
    - **Message Content Validation:** The generated output window displays the following message :

      A Ticket has been raised successfully your ticket number is

      <Ticket Number> regarding <Problem>.

2026-10-04 06:46:17	abel.tuter@example.com	Your Request for the issue has been submitted.	send-ready	SMTP	(empty)
